Roger,

When I look at the WBEM log :Framework.log, I see that it is failing on all the classes with a bunch of errors similar to the one below:

```
Impersonation running as: NT AUTHORITY\NETWORK SERVICE 06/26/2006
12:13:46.857 thread:1460 [d:\srvrtm\admin\wmi\wbem\sdk\framedyn\wbemglue.cpp.3759]
ExecQueryAsync: select __RELSPATH, LoadPercentage from Win32_Processor -
FAILED (80041003) 06/26/2006
12:13:46.857 thread:1460 [d:\srvrtm\admin\wmi\wbem\sdk\framedyn\wbemglue.cpp.830
```

Any ideas?

When I look at a machine that is working and not a DC, the impersonation is done by \\domainname\computername\$

Herman

Hmmm

I have not encountered what you report under those circumstances.

The KB is advisory that one should apply SP1 to the PDC FSMO first, or at least synchronously with other DCs.

The existence of the new level of DCOM security does not in the default configuration of fresh SP install have the impact you are indicating.

You would find that nesting such as Domain Admins in the DCom Users group would have no effect on your current issue.

Thanks for replying Roger.

The access is local and it only happens on the DCs of this domain.

Re: WMI and Windows 2003 SP1

Firewall
is turned off. I do not believe the Security Wizard was used.

What do you think about the article I listed earlier?

"Roger Abell [MVP]" wrote:

Is the access local, with the code running on the machine
whose
WMI repository is accessed, or remote?
Do these W2k3 have the firewall turned on?
Was the Security Configuration Wizard used to tighten
these?

Morning,

I have an issue were WMI is giving an acces
denied error when I try and
run
wmimgmt.msc. Also, when I run wbemtest
and try to access the
W32_Processor
class I get a Access Denied.

The server(s) in question are 2003 Standard
Edition SP1 boxes and I
think
this issue has something to do with this
article :
<http://support.microsoft.com/?kbid=914023>

Anyone have any ideas.
Thanks,
Herman
