Hi Will,

I usually use Passgen from
<http://www.protectyourwindowsnetwork.com/tools.htm>.

Personally I believe that there is no need to change password once a day — specially if you use long passwords (more then 14 characters).

Does any vendor make a product that will once a day change passwords for designated local accounts on each Windows computer, and then store those passwords encrypted in a central database so an administrator can retrieve them if needed in an emergency? I want a way to prevent users from using local accounts at all, and I also want to address the large security hole created by these accounts never changing their passwords.
