In article <#UzVljF2GHA.3476@xxxxxxxxxxxxxxxxxxxx>, neo@xxxxxxxxxxxxxxxx says...

Best guess based on googling... the certreq.exe tool. (e.g. on the IIS webserver, create the request via IIS management snapin and save to file. Copy the *.req file to the CA and use the certreq tool to submit it.)

"chris3 [MVP]" <nospamhere_chrisse@xxxxxxxx> wrote in message news:40564186-C69E-4166-A6F4-BB35DF2B83AA@xxxxxxxx

Hello,

Is there anyway to issue certificates to an IIS webserver that belongs to another Active Directory Forest than the Enterprise Root CA i'm trying to issue the certificate from. I tried to prepare a certificate request, but when i'm trying to import the request file i get an error message saying that the request doesn't contain any certificate template. Note: I don't have the IIS Web-Based enrollment installed since i want to avoid install IIS on the CA Server since it also a DC.

Any suggestions on this issue?

Thanks
Christoffer

Also, reconsider cohosting a CA and DC. The WEB interface makes life a lot easier> Also, most companies run into trouble down the road when they co-host a CA and DC, as it makes it very difficult to decommission (you cannot demote the DC, nor move certificate services to a different computer).

Brian
