When ever I try to access a specific remote server remotely with computer management the accounts get locked out. This happens on numerous accounts. Looking at the security log on the remote server I get even id 529 unknown username or bad password. However I can login without a problem using terminal services with the same IDs and passwords? This server is not in a domain and neither is the workstation from which I am trying to connect. The server is running Windows Server 2003 SP1 and the workstation is running XP SP2.

Any ideas on what might be causing this behaviour?

Thanks,
Hugh
