OK, I am working on Server 2003 SP1 at a school with over a 100 kids. I have successfully redirected their My Documents to point to their directory on the server. I needed to take ownership of their \Profiles in order to move their files to the new \User area.

Now, I think I need to remove Administrator as their profile owner and return ownership to each individual student—right? Is there a procedure that I can apply at the \Profiles folder and the \Users folder that will run through each student and remove the Administrator and replace it with their login name?

Thanx, Jim in Florida
