In article <1171652275.361557.67810@xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx>, Mshepherd00@xxxxxxxx says...

is it possible to have more than one CA signing certificate on one enterprise CA?

Or how to achieve this: to have two separate groups of computers using IPsec where one group enrolls automatically, the other manually or with approval. This should allow for restrictive and less restrictive IPsec filter rule sets on a server.

ms

An MS CA can only have a single signing certificate. You can accomplish what you are after by designing two certificate templates. One could be deployed to a specific security group using autoenrollment. The second could require CA manager approval
