Thanks again Roger, I posted to the SP groups before coming here. No one is replying, or suggesting, guess I'm on my own with this one.

Thank again, personally, I think it's a bug in the x64 interaction with Sharepoint ir IIS.

"Roger Abell [MVP]" wrote:

I would suggest that you post to one of the Sharepoint newsgroups as the granting of access to all sites on the Sharepoint server at the site admin level must be due to some misconfig of the Sharepoint roles. Just how that plays out with an account getting that level of access when authentication is behind the scene with integrated authentication, but is not the access level obtained when credentials must be explicitly provided upon prompt is, frankly, rather hard to fathom, at least assuming the same account is what ends up being authenticated in both cases.

In the meantime you might consider using the IE adm template settings via GPO to force the Internet options config on systems.

Roger,

Sorry I didn't answer your other points,

So, if a machine local account logs into an x64 XP it gets prompted when attempting access to any of those Sharepoint webs, but if ANY domain account logs in then it can access ANY of the Sharepoint webs

Re: Windows XPx64 does not require user authentication against Shar

even though some of them are restricted so they should not allow that domain account. Correct summary?

Yes this is correct, however without changing the settings that I discribed in my first reply, they don't get prompted, they have full access and that is not a good thing at al
