You are probably seeing an effect from the so-called "hidden child delete" that is part of a full control grant as is a requirement for Posix compliance.

Consider providing the Users group with Modify on U: or Modify and also Change Permissions and Take Ownership if you do really want them to have that. IIRC there is a discussion in the resource kit on the child delete included in full control.

Hi,

I have a mapped drive as follows

U:\ (users full)  
Shared Docs (users full)  
Computer Docs (users Read and Execute)  
Other Docs (users full)

In general it works as expected, ordinary users can't put docs into the "Computer Docs" folder, nor delete them. If they try to move a sub-folder of "Computer Docs" they get "Access Denied", BUT

If they drag and drop the WHOLE of "Computer Docs" into "Shared Docs", it lets them do it! No questions! I don't understand this because even though they're allowed to COPY the whole folder, I don't see how they can delete it after. It's as if MOVE by dragging and dropping is not seen as requiring a DELETE operation to complete??

Thanks for any help. This test was done with Win2k clients and servers, not sure if the o/s makes any difference.
