Have you specified the name of the Win2K3 server when adding the user account? (ie. SERVER\user). Is the Win2K server unable to resolve the username? Or am I misunderstanding the question and you are not able to edit the 'Log on as a service' setting at all?

We have a windows 2003 server that is a member server on a windows 2000 domain. I am attempting to add a local account from the win2k3 server to the log on as a service however i am unable to modify that setting on my win2k3 server. I can adjust it on windows 2000 servers in the domain. Is there a setting I am missing to make this adjustment.

We cannot edit it at all. Other settings are editable however this one is not. The icon is even different. Instead of the paper with blue markings it looks like 2 computers with a scroll in front of it.
