Tony,

It is not published anywhere or actually included in the OS from what I've been able to see. I had to find the file in one of the test builds we create in a special tools folder.

Hope this helps.

Yes, thank you. I am curious, however, where this utility is typically found??

Microsoft is telling me that a workaround for this issue would be to rename, delete or move the un-patched version of WMP6.4 binary (dxmasf.dll) to help secure your system. Also, they are saying that we can replace the un-patched version of WMP6.4 binary (dxmasf.dll) with the patched version.

Unfortunately I have tried doing these steps without luck
