Roger, thanks again.

not a problem at all Christian

I have tried all three solutions mentioned in this thread, but it is like no one can manage the situation the way I want. So what many of you said, now I'm thinking that the app I made to encode data should handle the authentication stuff

Unless you can hand authentication to the OS and take finer grain authorization on in your app (if the AuthN's context allows or not).

I really want to thank all the help I got from all of you. I wish I could help anyone the way you helped me in the future

Regards

Cheers

Roger, making my app to control access should be the last

Re: Permit only one network logon per user

option. Because
a matter of time, I need to find out a solution already builded,
already
tested, and rady-to-use.

I do not know of what that ready-to-use solution would be.
You app is controlling its listener and allowing/disallowing the
connections. If using clients are not using one of the operating
system's logins but rather just connecting to port your app uses,
which is what it is coming to sound like, then it seems it is only
your app that could exert the control.

Roger

Roger, you're right. I'm not
preventing, I have a clue if I
log trys
of multiple logins
The content is used
7*24*365. So a logged user
will keep logged all
the time. Any attempt to log
in with an already logged
credential is a
violation (or error).

You're also right about
cconnect, I'm rebuilding my
DC after trying,
but I think I made a mistake
and I'm going to try again

Another point is this, I need
to prevent access to a mms
(or http)
connection, not a shared
resource in a netowrk

Re: Permit only one network logon per user

All three methods indicated, cconnect, limitlogon, and the share-based of the KB provided, intend to prevent a second local login.

It sounds to me that you really want a mod in the app so that it does not allow a second connection to it using the same creds.

Hi
Christian,

I guess I do not understand how limiting to one session is in fact preventing unauthorized access.

Assuming it somehow does help, then how does it make sure that the correct person is the one allowed the one available session?

Anyway,
ccconnect
and
limitlogin

Re: Permit only one network logon per user

are fairly
heavy to
implement.
Take a look
at the
following
for the
select few
accounts
needed:
<http://support.microsoft.com/kb/260364>

I'm
building
a
product
that
is
accessed
with
a
username
and
password,
and
for
preventing
unauthorized
access
to
it,
I
need
to
prevent
multiple
simultaneous
logons
with
the
same
username

Re: Permit only one network logon per user

and
password

Sorry
about
my
English.
Let
me
know
if
the
answer
is
clear

Why
do
you
need
to
do
this?
What
security
risk
do
you
need
to
mitigate?

Hi,

I

have

Windows

2003

domain

working.

I

need

to

allow

only

one

network

logon

per

user.

The

example

is:

User:

username

Status:

Logged

If

user

username

try

to

Re: Permit only one network logon per user

login
from
a
different
machine,
and
he
is
logged
in
another,
the
login
attempt
must
be
denied

How
can
I
accomplish
this?

Thanks
in
advance
