It comes down to your forest design. If the two domains are in the same forest, then yes, the enterprise CA can process requests from both domains. If not, then you need enterprise edition for the cAs in both forests

Thanks.

My goal is allow users to make smart card logon with certificates from the /local/ CA and an external CA. I know that with a Standalone CA I can create certificates for users with arbitrary names (user1@xxxxxxxxxxxx, user2@xxxxxxxxxxxx, etc) and use them to perform smart card logon, but a Standalone CA cannot create certificates with the template "Smart card logon" , this certificates are available only in a Enterprise CA.

¿How can I accomplish this?

Thanks

.
