The following allows non-admins to manage shared folders. Create a local group, such as "Share Operators". Download and install TweakUI. Open TweakUI and click Access Control. Grant "Share Operators" full control over the following items:

- Manage file and print sharing
- Manage file/print server connections
- Enumerate file server disks
- Manage file server open files
- Manage file/print server sessions
- Manage administrative shares
- Manage file shares
- Manage printer shares
- Read file/print server statistics

Reboot the computer. To delegate access to manage shared folders, make the person a member of this "Share Operators" group. Note that all of the above permissions may grant more than the person actually needs. This is simply the list I use. Feel free to experiment by removing the group from one permission at a time, rebooting, and seeing how person's access changes.

Regards,

J Wolfgang Goerlich

I need to know what permissions are necessary to have a delegated admin create shares on folders.
