I have a Windows 2003 Standard Server installed as an Enterprise CA in my root domain. I have granted my user account a Code Signing certificate (using the built-in template) and successfully signed an Excel macro. However when I open up the file with the certificate I am still prompted to enable macros. Excel is stating that the digital signature is valid but it's coming from a publisher that is not trusted. I have verified that on my workstation the Enterprise CA is indeed in the Trusted Publishers store (this is replicated to all machines in our domain) and the certificate is valid on the CA. Why would it not be seeing this as from a Trusted Publisher? I have tried this on two Vista machines and a XP SP2 machine.

Mike
