Yes but that is not the point or the question as even long complex passwords are failing.

Even though this is a test network, you should still configure a reasonably secure password for the test accounts.

I setup a new test server, W2003, SP2, and attempted to add a few test users. This is not on our production network. No matter how I disable domain security settings and DC security settings I cannot add a user as I get the "Password does not meet the password policy requirements" dialog box

What did I miss here ?? I disabled or set to not defined all the settings in both the Domain server and domain security policies.
