David,

I believe that the issue here is not how to enable anonymous access but how to resolve the issue whereby people logged into the trusted domain are not having their credentials recognized when they try to access the folder.

The setting you indicate that adds Anonymous to Everyone is dangerous to use, and is not in and of itself sufficient to let unauthenticated access to the folder work. You later show that the NTFS is sufficient as it has a grant to Everyone (of course, that is provided that it is a DC that shares this, as you say you changed that setting for the DCs – double dangerous). You did not mention whether the share level permissions allow access to Everyone, which is needed also.

So, to the real problem. Is this a forest level trust (W2k3) so that it supports Kerberos?

Hi !

I want users with accounts in a trusted domain to access a network shared folder

in my domain. Of course, if they input their password, they can access.

But I want to enable the access without prompting the password.

I've read "Enable anonymous access on a domain controller" in following link

<http://technet2.microsoft.com/windowsserver/en/library/883c10c4-450a-4d0d-bec3-66135f2617111033.mspx>

I've set the policies in "domain security policy" and even "domain controller security policy" none of them worked not even simultaneously.

of

Course I've run "gpupdate" to.

Any ideas please ?

Thanks and regards
