Security templates can do this, which would be great if your machines have similar drive layouts as a group policy could then apply broadly.

Once you have defined the security template and saved it you would need to edit the text file to remove the DACL part of each node for which you had defined an entry in the template. Creating an NTFS specification in security templates that applies only SACLS seems beyond the GUI, but once you have removed the DACL part, they can be applied with the Security Configuration and Analysis snapin or via import into a GPO (but be careful there as GPOs get reapplied so that could cause excessive reapplication).

Due to Security requirements I have to setup and check auditing on directories for about 40 systems. Using auditpol.exe from the Win2K Resource

Kit I can setup the System level auditing. Does anyone know of a similiar command line tool or utility that will work with directory auditing (SACLS)?

The requirements are

1. needs to be US software(Security Req)
2. easy to obtain
3. should allow both checking the audit settings remotely and configuring the settings remotely, or using RCMD
4. Allow use in a batch file or script

Any help or ideas is appreciated  
Bob
