Hi,

Our server is Windows 2003 SBS R2. Group policy is configured to redirect "My Documents" on the clients to a folder on the server. This works great! Problem is that I need to move all these User folders to a different hard drive because of space issues.

Problem: The permissions on the folders are for the individual user ONLY. Even Administrator cannot access them! However I can take Ownership – but this completely resets the permissions so that only Administrator can access the folders. I don't want to reset permissions on 20+ folders for different users.

Is there a way to add permissions without going to each computer and using the user accounts to modify the permissions?

Thanks!

–Richard
