Jason,

What partition are you speaking of?

If it is the system boot partition (aka C:) then that is normal and probably should not be fooled with unless you really know what you are doing.

For any other partition, I would suggest that you define how you want permissions on the storage, and then set them from the topmost locations and let that setting then replace all that is below; then the next uppermost adding on the difference or otherwise adjusting to what is needed and again letting it propagate down replacing; etc.

Roger

Hi,

In the Properties Pages for some of the files on my Win2003 server, the "Allow inheritable permissions from the parent to propagate to this object and all child objects. Include these with entries explicitly defined here." checkbox is unchecked, while for others it is checked. I'm not sure how some of them got unchecked, but I want this checkbox checked for all items at all levels within this particular folder.

Do I have to go through the entire folder structure and look at the property pages for each file to know which ones I have to check the box for, or is there a better way? Can I specify this somewhere at the parent folder and let it trickle down to all the children files and folders? Is there a program that will do this for me?

Thanks in advance,

Jason
