Gents;

We have a compliance issue where our system admin is not supposed to have access to certain shares.

Any ideas as to how we can accomplish this seemingly mutually exclusive feat?

Thanks

As others have commented, you can take away the right for the administrator to access something on the box, but you can't keep it away if they really want to do something. You can, however, monitor the proper access levels through a solution like we offer (shameless plug: www.securitay.com/spm) and/or use of Microsoft's (or other) event log collection system. Through a combination of setting the correct policy (no access for admins) and then monitoring the systems so that the policy does not change, you can achieve the desired compliance level for your systems.

HTH,
Dave
