I'm trying to automate the build of a CA.  
My process works just fine, except for one small thing.

In addition to the CA's CN name, i would like to add the Distinguished Name Suffix.  
This is the X.500 distinguished name suffix that will be appended to the CA name.

I only see the following unattended answer file settings.

CAType  
Specifies the type of CA to install.

CSPPProvider  
Specifies the name of the Cryptography Service Provider (CSP).

HashAlgorithm  
Specifies the hash algorithm used by the CA to sign certificates.

KeyLength  
Specifies the key length for the CA.

Name  
Specifies the name of the CA.

ParentCAMachine  
Specifies the computer name with a CA that works as a parent CA with the current subordinate CA installation.

ParentCAName  
Specifies the parent CA name for the current subordinate CA installation.

SharedFolder  
Specifies the path to the folder that contains the configuration information for the CA.

UseSharedFolder  
Specifies whether to use the SharedFolder entry.

ValidityPeriod  
Specifies the number of periods, measured in units specified by ValidityPeriodUnits, for which the CA is valid.

ValidityPeriodUnits  
Specifies the units for the validity period of the CA.

I find it hard to believe that this entry is not documented anywhere.

## Automated CA Build Proces

Any help on Setting the DN Suffix in my unnattend.inf file?

.
