Hi,

I have member servers that we want to roll out a custom security template to. We created the template and verified the settings. we can analyze and configure.

not all the settings take. the security permissions for the ntfs and registry strings are not there.

when we re analyze we see a green check mark but when we go to the location (not in the mmc), we still see power users and others that should have been removed.

also

if i try to view the properties of the security items in the mmc, i get an error message saying "MMC has detected an error in a snap-in. It is recommended that you shutdown and restart the MMC.

Report error to MS and close

Ignore and continue

this is server 2003 sp2 and i reviewed kb915797 and even tried the hotfix but does not install because i have sp2 which is newer than the hotfix message appears.

any thoughts or suggestions. i am working in a test lab so if it craps out dont worry about it.

.
