I have the exact situation and asked similar questions here. I was told to create identical usernames and passwords on both machines thereby giving access to a user from machineA to machineB. This works however, you have to play with the permissions and security for the folder you are trying to share. Make sure that you add the username that you want to have access and then make sure that username has the right permissions set. All this is done by right clicking on the folder, properties, etc.

Hope that helps,  
Jim
