I have a single XP machine on a small network with 4 computers running windows 98. The xp machines's harddrive is partitioned, in c: and d: Partition d: is shared and all the other computers on the network can access it, no problem. However they cannot access any shares in the first patition, c: I can share any directory in c: with full rights, no problem. When I go to the other computers, in network neighborhood, I see the xp machine, when I click on it i see the shared folders listed, but when I click on any of the folders (excpet the one in d:) I get a message that says there is not enough memory to access resource, close some programs and try again. I get the same error in all 3 win98 machines. Obviously there are no programs running when I attempt to this. Ther is enough memory. What am i doing worgn? I went though all the sharing settings a hundred times.
