Thanks Doug.

I am using my W/S, not NTFS partition. The program is BDE of Delphi and it is located in the common folder in Program Files. The problem is that I don't know if the user is saving to a .cfg file or the registry or why he cannot save those info.

How can I adjust the permissions in the registry as well, as you said??

>-----Original Message-----

>Typically, a user or an application running under the user's credentials can write to the HKCU portion of the Registry. If you're running NTFS, you may need to give the Users group write/modify permissions for the application folder in question. If you find that a program is trying to write to the Registry, and can't, because of the user's account status, you can adjust the permissions in the registry as well.
