Squire – I have read your post on the 18th and the answers you were given should have sufficed.

Still here it is again.

Firstly disable Simple File Sharing. – This has been explained to you already.

Then once you have disabled "simple file sharing" you can see the Security tab on the properties of both folders and files.

Now all you need to do is read the Help and Support about File and Folder Permissions and apply them as you see fit.

Either enabling certain user access to files and folders or even using the deny access permission to explicitly exclude named users.

all of this is covered in the help. Don't forget to push through the permissions to all files and folders from a parent (if this is what you want).

You should also have no expectation that you are "owed" an answer from anybody in these peer to peer groups. If people do not choose to reply to you then multiple posts will only make them more inclined to not answer you in future, this is just good netiquette.

Finally the Help and Support center does actually contain a great number of answers and help to questions such as yours.

--

Regards,
Mike
