You can define a second admin account and then log in with that account to copy the profile from the first admin account to the new non-admin account.

Neither the copy from or to accounts can be in use when this is done, hence the second admin account.

It is best to do this after a fresh reboot, just to clear possible open, lazily flushed open handles.

This is accomplished in the Properties of My Computer using the Setting button in the User Profiles panel of the Advanced tab of the Properties. Highlight and use Copy To and set the permitted to use to the copied-to account. You copy to the root folder of the profile.
