Summary:

Windows 2000 server SP3, using Active Directory with 5 XP-Pro workstations sp2, everything was running fine till server drive crashed, reinstalled server on new drive, added all workstations to domain.

Problems are on 3 applications, these only occur logged in as the user not as admin.

Few issues may all be related,

- 1-Norton Antivirus now wants me to re-register it
- 2-Outlook tells me I dont have sufficient rights to open the PST file
- 3-Using Office XP Pro, some of the apps are asking me for the software key.

All of these problems occur on 4 out of 5 workstations, the only difference I can think of is when I rejoined the domain I was logged in as the user, put in admin login and password when requested but I said yes when asked if I wanted to create a local account for the user (regular user)

The one that works I joined the domain logged in as admin and it did not prompt me to create local account.

What have I dont to try and correct it.

User given admin rights at the PC level, no luck

User given server admin rights, no luck

User given domain admin rights, no luck

I deleted the user account and profiles under "Documents and Settings" on the workstation, removed it from the domain, deleted the computer from active directory and rejoined the domain logged in as admin and this time I was not prompted to create local user account.

microsoft.public.windowsxp.security_admin: Can't run application in XP, insufficient rights

Still can't use quickbooks (except run as), erro is insufficient rights, norton still wants me to re-register and Office Publisher wants a CD key.

Help, what did I do wrong, how can I make sure there are no lingering user rights which are recognized and keeping the apps from running.
