Hi Steven,

I tried that command several times. I even tried the /Overwrite option, all with the same result – no change. I don't get any error messages when I re-join the NT 4.0 domain. However, I did get an error message once when joining the Windows 2000 Domain saying something about the trust relationship failing between the computer and the domain, or the domain controller, I don't remember which. But, I seemed to get into the 2000 domain later anyway without any error messages. The event log even says that the group policy was applied successfully. We have ISA server, but the client was removed from one of the computers. I disable it on the other one, and re-set the option in IE, but that didn't seem to help either.

Unfortunately, these are a user's machines, so I don't have access to them all the time. I'm setting up another machine for one of the users to use temporarily so I can have full access to the computer that's giving me trouble. I'm trying to join the computer to a Windows 2000 domain. I moved 20 computer to the WIN2000 domain on July 13th. 2 out of those 20 computer now have this problem. The computers do show up in Active Directory after joining the domain – with properties just like the rest of the computers in the domain.

: -)
