Normally, starting, pausing, resuming, and stopping services are actions reserved to administrator accounts.

All services has a name that can be used with syntax

net stop dnscache

net start dnscache

(example stops and starts the caching DNS resolver)

So, you would only need determine the service names and be an admin.

It might be more simple to set their version of BlackIce to not run, and only enable it when you want to connect to the office (one more manual step when you VPN in) and run some other firewall the rest of the time.
