I have an XP Pro PC with 3GB of physical RAM and a SCSI controller and HDD. I need to be able to address all of that 3GB. Every time I check the Task Manager, the OS is only using ~1.7GB. I tried to use the /3GB switch to modify the boot.ini per Q316739. When I rebooted the PC, it was caught in an endless boot-loop. I have the latest service pack and all possible updates. I saw Q328269 and Q819636. The second KBA references SCSI controllers. I have one controller. Am I affected? Does anyone know where I can get the ntldr referenced in Q328269 and/or the scsiport.sys referenced in Q819636. I need help fast. Your assistance is greatly appreciated.

Peter
