To do this, you must be running NTFS as your file system on the drive in question. If your hard disk/partition is not NTFS you will need to convert it. To do this, open a Command Prompt window and enter the following command:

```
CONVERT X: /FS:NTFS
```

Where X: is the drive letter you wish to convert. You may also want to see <http://www.aumha.org/a/ntfscvt.htm> to ensure that you're getting the optimal conversion.

After this step is completed and you've rebooted the computer, if necessary:

XP PRO: In Windows Explorer, go to Tools, Folder Options, View and uncheck Use Simple File Sharing. Now, when you right click on a drive, folder or file (on an NTFS partition) and select Properties, you'll see a Security tab. Here you can assign or deny permissions based on user name or user group membership.

> If in one PC, with Windows XP Professional, some profiles exist. Is it
possible to limit the access to determined folders to each profile? For
example, profile X only has access to folder FX... profile Y only has access
to folder FY, and so on. The same to limit program execution.
