Paul,

Thanks for pointing me in the right direction on this one. I ultimately had to bite the bullet and scratched out my root partion an extra 2GB.

I did find out how to get user folders off the root partition, without "Folder Redirection", domains, or server software. Right-drag the folder to its desired new location and select "Move Here". This maneuver does not update registry MRU's, but I soon discovered MRU keys can be disabled for security reasons anyway.

I moved My Documents, Desktop, Favorites, SendTo, & Start Menu folders from the root, along with waxing windows components like Games, etc., which got me to 30% free space. Compressing the drive to save disk space got me to 31% free, but Defrag still needed more room to finish its job. The real gain I got seemed to be faster desktop wallpaper between window tasks. Perhaps adding user activity to an otherwise solitary swap disk resulted in less disk-spin-up.

For anyone else who's interested, the XP powertoy Tweak UI "Special Folders" may list the only ../client user folders in XP that can be relocated in this way. Moving other user folders caused sharing violations. Moving the "Quick Launch" folder caused a "Cannot Create Toolbar" error. A script at www.dougknox.com/xp/scripts_desc/xp_toolbar_error.htm recreates the Quick Launch folder.

Thanks again Paul.
