Hello,

I did as suggested. First, through Security/Advance for the shared drive, I had to reset the owner to Administrator for all subcontainers and objects. THEN, I reset permissions for children. Doing the latter without doing the former did not work. I would get an access denied message for the affected folders and files.

Further to the above, I think the problem stems from my creating folders and files from another peer-to-peer computer. When I create a folder or file on the shared drive using the second computer, the owner is me, karlo. There is no login user named karlo in the first computer. However, there is a karlo in security settings, giving karlo access to the shared drive.

I noticed that the problematic files or folders have no one assigned as owner. Is this an indication of the root cause of the problem? How can I create a folder or file in the first computers shared drive and ensure that all allowed Users retain access?

karlo
