Sjakie, don't have a compiler to hand to check this but:

```
protected void Application_AuthenticateRequest(Object sender, EventArgs e)
{
    if(Request.IsAuthenticated)
    {
        SqlDataReader reader;

        reader =
        SqlHelper.ExecuteReader(connection_string, CommandType.StoredProcedure, "rolesForUser", new
        SqlParameter("@Username", User.Identity.Name));

        ArrayList roleList = new ArrayList();

        while(reader.Read())
        {
            roleList.Add(reader["Name"]);
        }

        string[] roleListArray = roleList.ToArray(typeof(string));

        HttpContext.Current.User = new
        GenericPrincipal(User.Identity, roleListArray);
    }
}
```

Mmm, as I said no compiler to hand, so if it doesnt compile post back, b.t.w this isn't really the place to post this, you should post this in the C# newsgroups.

Regards
