Heres the deal, my school uses XP in one of its lab. They looked it down tighter then virgin. All we can do is access the programs they put on their, thats it. Or so they (the tech guys) thought.

3 weeks ago i was sitting in class and I got bored so I highlghted an icon, pressed controll C, controll V, and made the following pattern on the desk top

X X XXX X

X X X X

XXX X X

X X X

X X XXX X (HI! incase you cant see it clearly)

Except not so slopy. Any way, the extra icons copied them self to EVERY other computer on that certin network. Not the pattern, just all those extra icons. Now the tech support guys brought it up with the school principle saying what i did was "a risk to security" and that if i do ANY thing wrong on a computer for the rest of the year I ant touch school computers for the rest of the year! Does any one think that they are over reacting? That its their own fault for setting up the network wrong? I dont think I did anything wrong but they are acting like I installed a worm on the computer. "ctrl+c" and "ctrl+v" to make the above pattern, and they think im some 1337 hacker or something. Whats your view on this? Its just icons to a desktop they thought they put read only on.

--

Any help i provide you use at your own risk. I am not an expert, nor do i pretend to be.
