I have 3 computers in a small office that I am attempting to finish networking together. All three are connected to a small hub that allows them to access the same DSL connection. I have assigned each computer a static IP address, and also assigned each computer to the same workgroup. Here is where I get hung up. Each computer has a user account for the other two users. I did not set up the users, so am I to assume that each computer can see the other two, and therefore created a user account. If you look at each of the user accounts at the login screen, it shows the correct information as far as how many programs are running, unopened emails, etc. Looks to me that they can communicate with each other. However, I have a local printer that is hooked to machine 2, machine 1 needs to access it. I have enabled sharing, and assigned a name, but when you try to install it as a network printer, you cannot see any of the computers on the network. Nor can you see the workgroup in Network Neighborhood. Thanks in advance for any help, I am getting very frustrated!
