Ok then,
I have not added any software or hardware recently. The first time I did the repair install it restarted after doing it and still had the same problem. Now I don't have the option to do the repair install and even though I have tried the things to get a repair install it does not work. I couldn't get into safe mode because the NTLDR problem occured, now it still doesn't do any good because that error I told you about comes up. I have a western digital 120 gb hard drive. I am not sure what you mean SATA but it is hooked up by the IDE cable. (not external). SP2 has been installed for quite some time (XP Pro). I did the repair from the original XP CD with out SP2 so I guess that means it is not slipstreamed.

Thanks again
