You could try Regmon (free) from Systemalns. Here's the link:

<http://www.sysinternals.com/ntw2k/source/regmon.shtml>

You could run it under your account while using the software to find out what Registry keys it uses. Then you could apply permissions to those Registry keys. I still think using improperly coded software is not the best solution and suggest you use Windows wireless manager instead, but that is of course your choice.
