Hi

Just for info, as I am still trying different setup.

I reckon that this problem is caused by the new Msn Messenger v.7

I have tried your reset of the two services with no result

I have disabled different programs like skype, firewall, spyware protection

etc ... without success

But since I have disabled MSN from auto start with windows and taking the precaution to shut it down if I leave the PC for some time there is no more warning and no lockup for the last two days.

The problem might also be related in some ways to standby mode, hibernation or other power save mode???

I hope somebody will find the solution

747John
