Can you boot to safe mode?

David,

Thank you for your response. The reason why I think I have this worm, is because when windows starts up, immediately a window opens up with RPC notifying me that windows will shut down in 48 seconds or so. Once this happens, it also locks me from any further functions including the start button, and including the task manager. The computer freezes basically, then

proceeds to shut down. I've tried to get to the task manager to stop the processes, but can't get to task manager.

So far I've been able to press f8 and get to the command prompt and stop the rpc from shutting down by typing "sc failure rpcss reset= 0 actions= restart"

in the c: prompt. Which has stopped the rpc window from showing up. But now

I have the same problem of the computer freezing on me and not allowing me to do anything else.

I've also tried searching for the various Msblast.exe, Nstask32.exe, Penis32.exe, Teekids.exe, Winlogin.exe, Win32sockdrv.dll, or Yuetyutr.dll names on the command prompt and have had no luck. As of right now, i'm lost as to what to do.

I cannot open windows explorer, so that's out of the question...Any further advice????? Thanks, Perry
