Hi guys,

I've written a small batch script which itself calls Windows Scripting Host (cscript.exe), the purpose being that a remote webcam start broadcasting images. It all works well, but I'd like to be able to cancel this broadcasting script via another script, as I am actually connected to the host computer via ssh. In Unix, it'd be easy, a simple pipe "ps x | grep <scriptname> | kill" would get the process ID and kill it, but there is no such things on Windows. So does anyone know a scriptable way to stop another running script?

Thanks

Dietmar
