

Performance of Software DEP for all programs?

I am suddenly interested in enabling Software DEP for all my applications, especially in light of the news that it can stop exploits like the new WMF vulnerability.

The question I have not seen addressed anywhere concerns the performance of applications once DEP is enabled. Theoretically, will all applications under DEP suffer a performance hit? If so, how much? If there is a performance hit, is it significant enough to affect CPU intensive applications such as video capture/playback, games, etc?

Grateful for any info.

.
