Hi Leythos, & thanx for you help, here are my answers..

>You can't change the machine name

I have to login to machine, not domain as admin account change name and reboot into domain to acheive this!

>You had to enable the C\$ share, but the default IS to have a C\$ share

I didnt enable the share, it was already enabled but says I need to enable it to connect via TS!

>You can not access remote desktop when enabled

As above

>Can you ping remote computer #1?

No

>Can you type "net use \* \\computer\_IP\c\$" and not get an error?

No error below.

```
C:\Documents and Settings\Me.MyDOMAIN>net use W \\192.168.254.50\c$
System error 67 has occurred.
```

Windows FireWALL not enabled & File & Printer sharing is installed.

Strange isnt it. This occurs on only 8 XP machines out of AD where there are no OUs or basic security. I have taken this on when our company merged and there were no policies set before that.

Thanx

G

.
