First make sure your computer is 100% virus/malware-free:

http://www.elephantboycomputers.com/page2.html#Removing_Malware

Do not rely on NAV alone for non-viral malware.

When you know your computer is completely clean, if you are still getting the error use the System Configuration Utility to remove the startup entry:

Go to Start>Run and type (without quotes) "msconfig" [enter]. This brings up the System Configuration Utility. Look on the Startup tab and find the probable culprit. Uncheck the box next to its name, Apply and OK out. You don't need to restart immediately, but the next time you do you'll get a dialog saying you've used the Utility. Just tick the box that says in effect, "don't bother me about this again".

How to Troubleshoot By Using the Msconfig Utility in Windows XP –
