I installed a certain program as Administrator because it requires Administrator right to run. However, it somehow was automatically installed in the Startup path of every profile on my computer. When each profile is logged in, an error message is received stating that this one program can't open because they aren't administrator. I don't need this program in any other profile, how do I remove it from all the other profiles except the Administrator one? Is there a way to only install programs in the current profile and not the others?

If the shortcut to the program is in all accounts' Start Menu, just log into an account with administrative privileges and right-click on the Start button. Choose "Explore all Users", which will give you the familiar two-paned Explorer interface. Open each user's Start Menu and delete the program's shortcut from their Startup folder.

If the program's icon doesn't appear in their Startup folders, log into their accounts and use the System Configuration Utility to prevent startup. You might need to make those users administrators temporarily to run the Utility.

As for your last question, the installation routine is coded into the program so you would need to ask the people who wrote the software.
