Where was the policy applied – locally or domain/OU level?? If that registry key can be deleted on their computer somehow then it should clear that setting until the Group Policy is changed/forced refreshed again. If it is a domain/OU GPO setting then you could correct that setting and it should refresh over the VPN at the next GP refresh interval which may be up to a couple hours. You might also be able to remotely delete that registry key while it is connected via the VPN if you have SMB connectivity to that computer. --- Steve

A GPO setting was applied to a laptop at a remote location. The user can not longer run anything on their computer. Any ideas how I can get rid of the setting?

The GPO that was mistakenly set was "Administrative Templates\System\Run only allowed Windows applications" The registry location is "HKCU\Software\Microsoft\Windows\CurrentVersion\Policies\Explorer!RestrictRun" I can have the user login as another account and VPN in to our network but they can no longer login as themselves as the computer will not allow them to run anything. Help!!
