Sounds good. Thanks for letting me know what worked. I assume you removed the offending setting in Group Policy otherwise it could eventually refresh and apply to that user again. --- Steve

The policy is a domain/OU GPO. Unfortunately it is also one that tells the computer not to run any .exe file. I had the user login using another test account that happened to be on the computer (thank goodness) and had them VPN in. I was then able to load the users registry and delete the offending key. After a reboot is now able to get back to work ;o]. Thanks for the help. Teresa

Where was the policy applied – locally or domain/OU level?? If that registry key can be deleted on their computer somehow then it should clear that setting until the Group Policy is changed/forced refreshed again. If it is a domain/OU GPO setting then you could correct that setting and it should refresh over the VPN at the next GP refresh interval which may be up to a couple hours. You might also be able to remotely delete that registry key while it is connected via the VPN if you have SMB connectivity to that computer. --- Steve

A GPO setting was applied to a laptop at a remote location.
The user can

Re: Remove GPO setting Help!!

not
longer run anything on their computer. Any ideas how I can
get rid of
the
setting?

The GPO that was mistakenly set was "Administrative
Templates\System\Run
only allowed Windows applications" The registry location is
"HKCU\Software\Microsoft\Windows\CurrentVersion\Policies\Explorer!RestrictRun"
I can have the user login as another a
