You can put the computers you want to enforce the NTFS permissions on into an Organizational Unit. create a Group Policy to enforce the NTFS permissions, and then link it to that OU. Do NOT attempt to apply NTFS permissions at the domain level as it will then affect domain controllers and could cause complications. Place a couple test computers into the Organizational Unit first to make sure that the NTFS settings are exactly what you expect and that the user AND administrator can function normally on the computer and also check the NTFS settings for the documents and settings folder and user profile folders because if you incorrectly apply NTFS permissions with Group Policy you can mess those up particularly if forcing inheritance is used. Using Group Policy to manage NTFS settings is a bit tricky until you get used to it and removing the Group Policy will not reverse the settings to what they were. Also once the NTFS settings have been applied you may remove that Group Policy setting. Go to computer configuration/Windows settings/security settings/file system to see where to manage NTFS permissions. Another alternative is to use the cacls command in a batch file and use Group Policy startup or logon script to change NTFS permissions. A logon script would only work on folders that the user has full control permissions on while a startup script can be used on just about everything else. Also do not use deny permissions particularly for everyone/users groups as that will also affect administrators. --- Steve

You should be configuring your NTFS permissions on the operating system so that users do not have permission to create folders where you do not want them to. See the link below if you need help on how to do that. Offhand I don't know how to "hide" as you request but NTFS permissions are much better as hiding the interface in Windows Explorer will not prevent users from creating folders via the command line or through applications. When checking folder permissions always check the advanced page also. There for instance you will see that users can create folders in the drive/root folder but that can be changed. ---- Steve

Dear All,
How can we remove "File and Folder tasks" option from Windows explorer?
I removed "File" menu from Windows explorer through GPO. But this has no relevance as users can still create folders through this option. Kindly suggest me on this.
