There is a way you can password protect access to the computer so it will not boot. Usually you can hold down the delete key or F2 while the computer is being booted to access the computer [not operating system] settings. However if your sons can get access to the inside of the computer they can move a jumper to reset that password which you would know when your password no longer worked. Beyond that you may want to look into locking the computer up which can be done if you search the internet for computer safes. You also could look into having a removable drive tray installed in your computer case and you could lock up your computer drive or take it to work with you. Of course that would not stop them from installing another hard drive in the computer when you are gone if they have the means to obtain one. --- Steve
